According to our (Global Info Research) latest study, the global Breathable Explosion-proof Valve market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Breathable explosion-proof valve is a safety device in equipment or systems, mainly used to prevent explosion or rupture caused by excessive internal pressure. This kind of valve usually has the dual functions of breathability and explosion-proof, and can automatically open when the pressure is too high to release the internal pressure, thereby protecting the safety of the equipment or system.

The working principle of breathable explosion-proof valve is usually to trigger the opening or closing of the valve through changes in internal pressure. When the internal pressure reaches a certain value, the valve will automatically open and release the pressure to avoid damage to the equipment or system. This kind of valve usually has better sealing performance and pressure resistance, and can withstand higher pressure and temperature.
