Abstracts

A breather membrane is a thin sheet of fabric that sits above insulation and rafters, but underneath the roof slates. The construction of the fabric allows any condensation to rise up into the roof void but prevents the condensing water from dripping back down into your roof. Instead, it channels the water down into the gutter, preventing many problems.

Scope of the Report:

This report focuses on the Breather Membrane in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. Breathable membranes for walls tend to be of a generally lower specification than those used within roofs due to the nature of the application. Normally a roof breather would also be suitable as a high specification wall breather, but a wall breather would almost certainly not be suitable for use in a roof.

The worldwide market for Breather Membrane is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
