Abstracts

The global Brick-Lined Copper Cold Wall market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The brick-inlaid copper cold wall is a cooling device used in high-temperature industrial furnaces. It is mainly used to cool the inner wall of the furnace to protect the furnace structure from being eroded by high-temperature furnace gases. The brick-inlaid copper cold wall is made of copper material and is inlaid with high-temperature-resistant bricks on the surface. It has excellent thermal conductivity and corrosion resistance. The working principle of the brick-inlaid copper cold wall is similar to that of the smooth copper cold wall. By flowing the cooling medium (such as water or other coolant) through the cooling pipe inside the cold wall, the cooling medium absorbs the heat inside the furnace, thereby reducing the temperature of the furnace. The temperature of the inner wall. Different from the smooth copper cold wall, the outer surface of the brick-inlaid copper cold wall is inlaid with high-temperature resistant bricks. These bricks can withstand the erosion of high-temperature furnace gas and play the role of heat insulation and protection of the cold wall. The advantage of the brick-inlaid copper cold wall is that it can protect the cold wall from corrosion in high temperature environments and extend the service life of the equipment. At the same time, copper material has good thermal conductivity and can quickly transfer the heat inside the kiln to the cooling medium to achieve rapid cooling. The inlay of bricks can provide an additional layer of insulation, reduce the temperature of the cold wall and improve the cooling effect.
