Abstracts

The global Bright PET Chips market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The market prospect for Bright PET Chips is promising due to their wide range of applications and the growing demand for polyester-based products. Bright PET Chips, with their high content of titanium dioxide, offer enhanced brightness and opacity to PET materials, making them attractive for various industries. The use of polyester is expanding in fiber production, packaging materials, films, engineering plastics, and more. As these sectors continue to grow, the demand for Bright PET Chips is expected to increase. Additionally, the advantages of the PTA method, including low raw material consumption and short reaction time, make Bright PET Chips a preferred choice for manufacturers. Overall, the market prospect for Bright PET Chips seems positive, driven by the expansion of the polyester industry and its versatile applications.

The content of titanium dioxide in Bright PET Chips is about 0.10%. Polyester chips usually refer to the polyester raw materials produced by polymerization are generally processed into about 4*5*2 mm flake particles. The process of polyester production includes direct esterification (PTA) method and transesterification (DMT) method. PTA method has the advantages of low raw material consumption and short reaction time, and has become the main process and preferred technical route of polyester since the 1980s. The large-scale production line is a continuous production process, and the semi-continuous and intermittent production process is suitable for medium and small production units. The use of polyester now includes fiber, all kinds of containers, packaging materials, films, films, engineering plastics and other fields.
