The global Broadband Limiting Amplifier market size is expected to reach $ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A broadband limiting amplifier is an electronic device that amplifies signals while also limiting their amplitude or peak power level. It is mainly used in communication systems to prevent signal distortion and ensure signal quality. The amplifier has a fixed output level, above which it limits the amplitude of the input signal. This helps in maintaining the required signal levels and preventing overloading of downstream components. Broadband limiting amplifiers are often used in applications such as wireless communication, satellite communication, and radar systems, where maintaining signal integrity and preventing interference is crucial.
