Abstracts

The global Broadband Triple Bonded Achromatic Lens market size is expected to reach $ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A broadband triplet achromat is an optical lens that reduces chromatic aberration by combining lenses of different materials. Such lenses are typically made from three different glass materials, each with a different index of refraction. Combining these materials reduces the dispersion of the lens, thereby reducing chromatic aberration. The manufacture of such lenses requires a delicate process, because the refractive index of different materials must be precisely controlled. Broadband triplet achromatic lenses are often used in high-end camera lenses, telescopes, microscopes and other optical equipment to provide clearer and more accurate images.
