Abstracts

The global BRT Signal Priority System market size is expected to reach \$ 633 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

The Bus Rapid Transit Signal Priority System is an urban transportation solution designed to improve the efficiency and punctuality of bus services by providing signal priority for bus vehicles. This system is the core part of the Bus Rapid Transit (BRT) construction and can effectively solve the urban congestion problem. It uses technical means such as intelligent transportation systems (ITS) to ensure that BRT vehicles can operate quickly and on time, thereby improving the operational effects of the entire bus system.

The Signal Priority (SP) market for Bus Rapid Transit (BRT) is experiencing continuous growth, primarily driven by the demand for faster and more congested urban public transport, as well as improved punctuality and attractiveness. On corridors with more severe congestion and higher efficiency requirements, SP works in conjunction with vehicle detection/location (such as GPS/OBU, vehicle identifiers) to link with traffic signals, triggering extended green lights, shortened red lights, or phase optimization, thereby reducing bus delays. The current market exhibits a trend of 'pilot projects followed by large-scale replication,' with technological advancements towards more real-time, robust algorithms and lower deployment costs for vehicle-road cooperation. However, it also faces challenges such as varying road conditions, compatibility of signal control strategies, maintenance and upgrade costs, and cross-departmental data sharing and standardization. Overall, with increased investment in smart transportation platforms and urban renewal, SP is gradually moving from single-point trials to platform-based and systematic integration.
