According to our (Global Info Research) latest study, the global Brush Motor market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

A brushed motor is an internally commutated electric motor designed to be run from a direct current power source. Brushed motors were the first commercially important application of electric power to driving mechanical energy, and distribution systems were used for more than 100 years to operate motors in commercial and industrial buildings. Brushed motors can be varied in speed by changing the operating voltage or the strength of the magnetic field. Depending on the connections of the field to the power supply, the speed and torque characteristics of a brushed motor can be altered to provide steady speed or speed inversely proportional to the mechanical load. Brushed motors continue to be used for electrical propulsion, cranes, paper machines and steel rolling mills. Since the brushes wear down and require replacement, brushless DC motors using power electronic devices have displaced brushed motors from many applications.

The Global Info Research report includes an overview of the development of the Brush Motor industry chain, the market status of Industrial Equipment (Electrographite Brush, Graphite Brush), Automotive Application (Electrographite Brush, Graphite Brush), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Brush Motor.
