Abstracts

The global Brushless DC Pump market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

A brushless DC water pump is a water pump driven by a brushless DC motor. Compared with traditional brushed DC motors, brushless DC motors do not require the use of carbon brushes for contact between the brushes and the rotor, thus reducing friction and wear and increasing efficiency and lifespan. This kind of water pump usually consists of a motor, a rotor, a magnetic field sensor and a control circuit. The working principle of the brushless DC water pump involves the change of the magnetic field inside the motor and the adjustment of the current direction to achieve water pumping. Because brushless DC motors use an electronic control system to manage current and magnetic fields, they are able to regulate the operation of the water pump more precisely, increasing efficiency and reducing energy consumption. This type of water pump is often used in applications that require small size, high efficiency, and low noise, such as household equipment, cooling systems, temperature control equipment, etc.
