Abstracts

According to our (Global Info Research) latest study, the global Building Energy Management Service market size was valued at US\$ 825 million in 2025 and is forecast to a readjusted size of US\$ 1744 million by 2032 with a CAGR of 11.6% during review period.

Building Energy Management Services are the people-and-process part of building energy management. If a Building Energy Management System (BEMS) is the ?tool? that measures, visualizes, and controls energy use, then services are the work that makes the tool deliver real results. In most buildings, energy waste is not caused by one big mistake. It comes from hundreds of small issues: schedules that drift, sensors that fail, valves that stick, setpoints that are too aggressive, and equipment that runs when it should rest. Services cover the full cycle: planning what to measure, installing and integrating metering and controls, checking that systems work as designed, and then continuously improving performance month after month. The market therefore includes energy audits and studies, commissioning and retro-commissioning, system integration, energy data management, fault detection and diagnostics support, optimization, reporting, training, and ongoing operational support.

A practical way to define this market is to focus on who owns the responsibility for energy performance. In a ?do-it-yourself? approach, the building owner buys software and hardware, and internal staff try to manage energy on their own. In an energy management services approach, the owner pays a specialist team?sometimes a controls contractor, sometimes an energy service company, sometimes a software vendor with a services arm?to run energy management as a managed operation. This includes routine tasks (weekly reviews of alarms and trends), seasonal tasks (summer

and winter tune-ups), and project tasks (fixing repeated faults, retesting control sequences, adjusting ventilation strategies, or rebalancing hydronic systems). Services often include measurement and verification so owners can see if actions truly reduced energy use, not just moved the problem somewhere else.

A clear market trend is the shift from one-time projects to continuous improvement programs. In the past, many owners paid for an energy audit, then did a retrofit, then moved on. Today, more owners want continuous commissioning, ongoing fault management, and regular performance reviews, because building performance degrades over time. Public energy programs describe fault detection and diagnosis tools as a kind of “check engine light” for building HVAC systems—finding issues and sometimes helping fix them. That mindset strongly supports services: even if software can detect a fault, someone must confirm it, prioritize it, create a work order, fix it, and verify the result. This pushes the market toward service contracts that bundle analytics with human follow-through.

Another trend is the rise of portfolio-level services. Large owners—retail chains, healthcare networks, universities, property managers—do not want each site to behave differently. They want standard dashboards, standard KPIs, and a repeatable way to find the worst-performing sites quickly. Services teams increasingly operate like a remote “energy control center,” reviewing many buildings from one place and sending targeted actions to local technicians. This approach is attractive because many organizations face staffing constraints. Fewer experienced operators are expected to manage more complex systems. Remote services can fill gaps, provide training, and make performance more consistent across sites.

Decarbonization strategies also change what services must deliver. Many buildings are moving toward electrification (heat pumps, electric boilers), adding EV charging, and adopting more advanced ventilation control for comfort and air quality. These changes can reduce emissions, but they also add complexity. Services increasingly include tariff analysis, demand management, and strategies to avoid creating new peak loads that raise utility costs. In some regions, owners also want to participate in demand response or flexible load programs, which requires careful control and verification. The service value here is not only “use less energy,” but “use energy at the right time and in the right way,” while still meeting comfort and operational needs.
