Building-side heat rejection systems are components of a building's heating, ventilation, and air conditioning (HVAC) infrastructure designed to expel excess heat generated within the building to the external environment. These systems are essential for maintaining indoor thermal comfort and efficient energy use, especially in cooling applications. Common types include cooling towers, air-cooled condensers, and evaporative condensers, which transfer heat from the building's chilled water or refrigerant systems to the surrounding air or water. The selection and design of these systems depend on factors such as climate, building size, energy efficiency goals, and environmental regulations.
