The global Building Vibration Isolator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Building vibration isolator is a device designed to reduce or isolate the transmission of vibration and noise from mechanical equipment or external sources to the building structure. They are usually used in various industrial, commercial and residential environments to protect building structures and occupants from the harmful effects of vibration and noise. Vibration isolators are usually made of rubber, neoprene, steel springs or a combination of these materials. They are installed between the equipment or vibration source and the building structure to reduce the transmission of vibration and noise. Vibration isolators are usually used for HVAC (heating, ventilation and air conditioning) equipment, generators, compressors, pumps and other types of mechanical equipment.
