Abstracts

According to our (Global Info Research) latest study, the global Bulb and Ballast Recycling market size was valued at US\$ 2449 million in 2025 and is forecast to a readjusted size of US\$ 3470 million by 2032 with a CAGR of 5.1% during review period.

Bulb and ballast recycling refers to the service of properly disposing of and reclaiming materials from light bulbs and their associated ballasts, which are components used in fluorescent and High-Intensity Discharge lighting systems. These items contain materials that can be hazardous to the environment and human health if not handled correctly. Bulb and ballast recycling is an important part of responsible waste management and is often required by law in many jurisdictions. It helps to protect the environment and public health while also supporting the circular economy by reclaiming valuable materials.

The bulb and ballast recycling industry's dominant trends center on mandatory extended producer responsibility (EPR) policies worldwide, automated AI sorting and closed-loop hazardous material recovery for mercury-containing lamps and PCB-laden legacy magnetic ballasts, plus rising demand for one-stop lighting waste disposal amid large-scale LED retrofits replacing fluorescent and HID fixtures; major opportunities stem from municipal government hazardous waste procurement contracts, corporate ESG compliance requirements, recoverable high-value resources including glass, copper, rare phosphors and purified mercury for industrial reuse, and mobile on-site collection services targeting commercial buildings, industrial parks and old public infrastructure renovation projects; meanwhile, the sector faces persistent challenges such as high upfront capital expenditure for sealed mercury capture and PCB detoxification equipment, volatile prices of recycled metal commodities, widespread

unlicensed informal recyclers undercutting formal service fees, strict cross-border hazardous waste transportation restrictions, complex classification testing costs to separate PCB and non-PCB ballasts, and gradually shrinking waste volume of traditional fluorescent bulbs as full LED penetration accelerates long-term demand pressure on lamp recycling segments.
