A Semiconductor Burn-In Test System is a specialized equipment used to test the reliability and durability of semiconductor devices over an extended period of time. Burn-in testing involves subjecting the semiconductor devices to elevated temperatures and operating conditions for several hours or days to simulate the effects of long-term use. The Semiconductor Burn-In Test System typically includes a device under test (DUT) board, a temperature control system, a power supply, and a data acquisition and control system. The DUT board holds the semiconductor devices and provides electrical connections for testing. The temperature control system maintains a precise temperature range during the testing process, while the power supply provides the required voltage and current to the devices.
