The global Bus Resistor Network market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A bus resistor network is a circuit configuration commonly used to connect multiple resistors in an electrical system to form a resistor network for a specific function or to meet a specific application need. These resistors are connected together by sharing an electrical bus, allowing communication, data transfer, or signal transfer between multiple resistors. In a bus resistor network, multiple resistors are usually connected on an electrical bus, which can be a serial bus (such as I2C, SPI, RS-485, etc.) or a parallel bus (such as a data bus, address bus, etc.). Each resistor has a unique address or location on the bus, and by selecting the corresponding address or location, one of the resistors can be selected and accessed. Bus resistor networks can be used in a variety of applications such as resistor adjustment, resistor voltage division, resistance measurement, etc. in analog and digital circuits. They are usually programmable and flexible, and can be programmed or configured to adjust the resistance value to achieve different circuit functions or system requirements. In addition, bus-type resistor networks can also be used for communication and data transmission between multi-channel sensors, controllers or processors, enabling complex control and communication functions.
