Abstracts

The global Bus Welding Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Busbar welding machine, which is a device used to join the metal parts of buses together. Busbar welding machines have different types and applications, which can be divided into the following according to the different energy used and welding processes:

MIG welding machine: Using metal inert gas as a shielding gas, the consumable electrode (usually copper plated steel wire) is melted and filled into the weld by an electric arc. This type of welding machine is suitable for large and heavy materials, with fast speed and low cost.

TIG welding machine: using tungsten inert gas as a shielding gas, the unconsumed tungsten electrode and additional filling material (such as steel wire or rod) are melted and filled into the weld by electric arc. This type of welding machine is suitable for thin and small materials and can produce precise and clean welds.

Spot welding machine: Uses resistance heating to press two pieces of metal together and create melting and joining at the point of contact. This type of welding machine is suitable for materials with flat surface and the same thickness, simple operation and high efficiency.

Laser welding machine: Uses a high energy density laser beam to heat the material until it melts or vaporizes, and forms a connection after cooling. This type of welding machine is suitable for high-strength, high-precision, and high-speed welding, and can handle complex and tiny shapes.

Ultrasonic welding machine: uses high-frequency vibration to rub the surface of the material to plastic deformation, and form a connection under pressure. This type of welding machine is suitable for the welding of non-metallic or dissimilar metals, without filling materials or shielding gases, energy saving and environmental protection.
