Abstracts

According to our (Global Info Research) latest study, the global Business VoIP Services market size was valued at USD 28010 million in 2023 and is forecast to a readjusted size of USD 32950 million by 2030 with a CAGR of 2.3% during review period.

VoIP functions on broadband networks using packet switched telephone networks (PSTNs), unlike traditional calls on circuit switched networks. PSTNs are more efficient than legacy systems (circuited switched networks), and information can be routed in packets over optimized paths. VoIP allows IP calls over mobile networks (3G/LTE) or fixed networks, such as wireless hotspots, Wi-Fi, and worldwide interoperability for microwave access (WiMAX) networks. VoIP bypasses the originating mobile carrier's telephony network and allows inexpensive calls on mobiles through the ISP networks. It also offers low-cost international calls, and roaming calls, without the need for extensive infrastructures such as PCs and DSL modems.

A large number of consumers are still apprehensive about the use of voice communication over internet bandwidth on account of data privacy and security concerns. This is anticipated to restrict the adoption of VoIP services. In addition to this senior citizens are not used to voice communication over the internet and find it more comfortable to make use of analog telephone lines for voice communication. This is expected to limit the growth of the VIP Services Market. In addition to this, senior citizens are also apprehensive about the quality of communication over internet bandwidth and refrain from upgrading themselves to the latest technology and continue to make use of and love telephone lines for voice communication.

The Global Info Research report includes an overview of the development of the
