According to our (Global Info Research) latest study, the global Button Battery Punching Machine market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The button battery punching machine is a device specially used to make button batteries. Its working principle mainly involves the stamping and forming of the mold. The equipment consists of two upper and lower molds, of which the lower mold is fixed and the upper mold moves up and down by air pressure or hydraulic pressure. During the stamping process, the positive and negative electrodes are placed in the positioning grooves of the upper and lower molds respectively, and then the upper mold is pressed down by air pressure or hydraulic pressure, so that the positive and negative electrodes are deformed by extrusion to become a complete button battery.

The structure of the button battery punching machine is relatively simple, but very precise. It mainly consists of a fuselage, upper and lower molds, an air pressure or hydraulic system, a control system, etc. The fuselage is usually made of high-strength materials to ensure the stability and durability of the equipment. The upper and lower molds are customized according to the specifications and models of the button battery to ensure that the size and shape of the punched battery meet the requirements. The air pressure or hydraulic system provides power so that the upper mold can be pressed down accurately and quickly. The control system is responsible for controlling the entire

stamping process, including the closing and opening of the mold and the stamping speed.
