Abstracts

According to our (Global Info Research) latest study, the global C4 Fraction Selective Hydrogenation Catalyst market size was valued at US$ 183 million in 2025 and is forecast to a readjusted size of US$ 265 million by 2032 with a CAGR of 5.4% during review period.

In 2025, global sales volume of C4 Fraction Selective Hydrogenation Catalyst is estimated at approximately 1,150 tons, with an average global market price of about USD 155/kg. The gross margin of major producers is generally in the range of 35%-50%.

C4 Fraction Selective Hydrogenation Catalyst is a petrochemical catalyst used for the refining of mixed C4 fractions. It mainly uses palladium-based precious metals or nickel-based non-precious metals as active components, supported on alumina and other carriers. Its function is to selectively remove highly active unsaturated impurities such as vinyl acetylene, ethyl acetylene and butadiene from C4 streams, while retaining valuable components such as butene and isobutene as much as possible, thereby reducing side reactions, coking and catalyst deactivation in downstream units.

The upstream of C4 Fraction Selective Hydrogenation Catalyst mainly includes palladium, nickel salts, alumina carriers, promoters and forming materials. The midstream involves catalyst formulation design, loading modification, forming, calcination and performance evaluation. The downstream applications mainly include butadiene extraction, etherification, alkylation, butene separation and other C4 deep-processing processes. The product value is mainly reflected in hydrogenation selectivity, impurity conversion rate, butene loss control and long-cycle operation
