Condenser, as a component of refrigeration system, is a kind of heat exchanger, which can convert gas or steam into liquid and transfer heat in the pipe to the air near the pipe in a fast way. The working process of the condenser is an exothermic process, so the temperature of the condenser is high. Many condensers are used in power plants to condense steam from turbines. In the refrigeration plant, condensers are used to condense refrigeration steam such as ammonia and freon. Condensers are used in the petrochemical industry to condense hydrocarbons and other chemical vapors. In the distillation process, the device that converts steam into liquid is also called condenser. All condensers operate by taking away the heat of gas or steam.
