Abstracts

The global Cadmium Bearing Silver Solder market size is expected to reach \$ 196 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

Cadmium-containing silver brazing filler metal is an alloy solder in which cadmium (typically 5%-26%) is added to silver-based brazing filler metal. The addition of cadmium significantly lowers the melting point, improves wettability and fluidity, and reduces the brazing temperature by 50-100°C. It possesses good processability and joint strength, and is widely used in refrigeration, electromechanical, and instrumentation industries. However, due to the toxicity of cadmium, it is subject to strict environmental regulations.

Upstream industries mainly include suppliers of raw metals such as silver, copper, zinc, and cadmium, involving precious metal smelting and alloy melting processes.

Downstream industries cover refrigeration and air conditioning, electromechanical manufacturing, instrumentation, and hardware tools, serving flame brazing and induction brazing of materials such as copper alloys, steel, and stainless steel, and achieving sales through welding material distribution channels. The global price of cadmium-containing silver brazing filler metal is US\$58,000/ton, with annual sales of approximately 2,505 tons, global production capacity of 3,000 tons, and an industry profit margin of 18%.

The global cadmium-containing silver brazing filler metal market is facing the dual challenges of strict environmental regulations and the accelerated development of alternative technologies. Due to the severe toxicity of cadmium to humans and the environment, the EU RoHS directive and environmental regulations in various countries

impose strict restrictions on its use, leading to the gradual phasing out of cadmium-containing solders in electronic and electrical equipment. Market demand is rapidly shifting towards cadmium-free and environmentally friendly products. Cadmium-free silver solders (such as silver-copper-zinc-tin and silver-copper-zinc-indium) are gradually replacing cadmium-containing products due to their near-cadmium-containing solder performance. In traditional fields such as refrigeration and electromechanical engineering, cadmium-containing solders are still used in some countries, but their application continues to shrink.

This report studies the global Cadmium Bearing Silver Solder production, demand, key manufacturers, and key regions.
