Abstracts

According to our (Global Info Research) latest study, the global Cadmium Electroplating Service market size was valued at US\$ 585 million in 2025 and is forecast to a readjusted size of US\$ 653 million by 2032 with a CAGR of 1.6% during review period.

Cadmium electroplating service uses electrolysis to deposit a layer of cadmium on the surface of steel parts. Cadmium plating offers several benefits, including corrosion resistance, lubricity, solderability and electrical conductivity. It is mainly used to prevent corrosion from sea water or salt spray, improve assembly tightness and friction, and increase appearance.

The global Cadmium Electroplating Service market is a mature, niche, compliance-driven surface finishing market**. Unlike general electroplating, cadmium plating is no longer a broad commercial coating because cadmium is toxic and heavily restricted. Demand is now concentrated in aerospace, defense, military aircraft, marine, high-reliability connectors, fasteners, landing gear, hydraulic components, and MRO replacement parts, where cadmium's corrosion resistance, lubricity, solderability, conductivity, and compatibility with aluminum remain difficult to fully replace.

The main demand driver is not mass production, but mission-critical performance. Cadmium plating remains specified where parts face salt spray, galvanic corrosion, threaded assembly/disassembly, high-strength steel embrittlement concerns, and electrical-contact requirements. Typical parts include aerospace fasteners, landing gear parts, actuators, hydraulic fittings, connectors, brackets, and defense hardware.

The market is fragmented and regionally service-based, because cadmium plating

requires local approvals, hazardous-waste management, customer process approvals, and often Nadcap / AS9100 / aerospace OEM certifications.

North America is the strongest region, supported by U.S. aerospace, defense, MRO, military aircraft, and high-certification metal finishing suppliers. Europe remains important but is more constrained by REACH and environmental compliance, so demand is concentrated in aerospace and defense exemptions. Asia-Pacific has selective demand from aviation, defense, marine, and industrial export supply chains, but commercial electronics and automotive uses are increasingly replaced by zinc-nickel, zinc alloy, electroless nickel, aluminum IVD, and other alternatives.

The market is shifting from broad cadmium use toward controlled, specification-driven cadmium plating plus cadmium replacement programs. Zinc-nickel plating, ion vapor deposited aluminum, electroless nickel, tin-zinc, and other engineered coatings are gaining share where they meet performance requirements. However, no single substitute fully matches cadmium across corrosion resistance, lubricity, conductivity, solderability, and aerospace legacy approval, so cadmium remains in use for qualified legacy platforms and safety-critical parts.
