According to our (Global Info Research) latest study, the global Cadmium Sulfide Photodetector market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A cadmium sulfide photodetector is a photosensor based on cadmium sulfide (CdS) semiconductor material, also known as a CdS photoresistor. It has a photoelectric conversion function, which can convert optical signals into electrical signals for output. The working principle of the cadmium sulfide photodetector is based on the photoelectric effect of the cadmium sulfide semiconductor material, that is, under light irradiation, the free electrons and hole pairs in the cadmium sulfide semiconductor are excited to change the resistance value. The stronger the light intensity, the greater the reduction in the resistance value. Cadmium sulfide photodetectors are usually used as photosensitive elements and are widely used in photoelectric automatic control, photoelectric measurement, photoelectric signal transmission and other fields. For example, in the field of lighting, cadmium sulfide photodetectors can be used to sense changes in light intensity, thereby realizing functions such as light control switches and automatic dimming; in the field of photoelectric signal transmission, cadmium sulfide photodetectors can be used to convert light signals into Electrical signals for applications such as optical communications.
