According to our (Global Info Research) latest study, the global Cadmium Zinc Telluride Detector market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Cadmium zinc telluride detectors are a new type of semiconductor detector that has developed rapidly in recent years. They have the characteristics of high spatial resolution, high energy resolution and can work at room temperature. Unlike traditional single-element detectors, Cadmium zinc telluride detectors have high photoelectric absorption efficiency because their Cd and Te have higher atomic numbers than Si, and their high carrier mobility lifetime product (?) ensures that carriers are more difficult to be captured during transport to the electrode. These characteristics make the detection efficiency of Cadmium zinc telluride detectors for 60 keV rays reach more than 95%, far exceeding the 10% of Si detectors, and have become the most promising detector in the field of high-energy rays.
