Abstracts

According to our (Global Info Research) latest study, the global Calcium-Sensing Receptor pAb market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Calcium-Sensing Receptor pAb, that is, calcium-sensitive receptor polyclonal antibody, is a G protein-coupled receptor that is mainly located on the cell membrane and is highly sensitive to changes in extracellular calcium ion concentration. Polyclonal antibody (pAb) is a mixture of multiple antibodies against the same antigen epitope produced by multiple B cell clones. This antibody specifically recognizes and binds to calcium-sensing receptors and is used to detect, locate or study the expression and function of calcium-sensing receptors in cells or tissues.

As a research tool, CaSR pAb has a wide range of applications in life sciences, medical research, drug development and other fields. It can help scientists understand the role of calcium-sensitive receptors in cell signaling, calcium homeostasis regulation and other aspects, and thus provide new ideas and methods for the treatment of related diseases.

With the continuous deepening of life science research and the continuous development of medical technology, the demand for high-quality and high-specificity antibodies continues to increase. As an important tool for studying calcium-sensitive receptors, the market demand for CaSR pAb has also increased accordingly.

The continuous innovation of antibody production technology, such as hybridoma technology, genetic engineering technology, and single-cell sequencing technology, has

provided more possibilities for the production of CaSR pAb. These technologies not only improve the specificity and affinity of antibodies, but also reduce production costs and promote the expansion of the market.

In summary, as part of the biological reagent market, the CaSR pAb market has broad development prospects and huge market potential.
