Abstracts

Calcium-zinc stabilizer is synthesized with calcium salt, zinc salt, lubricant, antioxidant, etc. as the main components by a special compounding process. It can not only replace toxic stabilizers such as lead and cadmium salts and organic tin, but also has good thermal stability, light stability, transparency and tinting strength. Practice has proved that in PVC resin products, it has good processing performance and thermal stability equivalent to lead salt stabilizers, which is a good non-toxic stabilizer.

According to our (Global Info Research) latest study, the global Calcium-Zinc Heat Stabilizer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Liquid calcium-zinc stabilizer is a complex of calcium-zinc organic salts, phosphites, polyols, antioxidants and solvents. Liquid calcium zinc stabilizer has good compatibility with resin and plasticizer, good transparency, not easy to precipitate, less dosage and easy to use. The main disadvantage is that the lubricity is poor, the softening point of the product is reduced, and the long-term storage will deteriorate.

The solid complex calcium-zinc soap stabilizer is dominated by stearic acid soap, followed by lauric acid soap and oleic acid soap. The product is characterized by good lubricity, does not reduce the softening point of PVC rigid products, and is suitable for the processing of rigid PVC pipes and profiles.
