Abstracts

According to our (Global Info Research) latest study, the global Camellia Oil Refining Equipment market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The crude oil is filtered through a plate and frame filter to filter impurities such as sediment and cake residue, and then enters the production line through a crude oil pump, where the colloid and impurities in the crude oil are removed first, and then enters the decolorization pot, where the grease is absorbed by physical adsorption The pigments, trace metals, suspended solids, etc. in the oil enter the deodorization pot through the gear pump to remove the plant odor contained in the tea seed oil. The tea seed oil contains a little wax, which will be present in the oil at low temperature. The flocs will also affect the taste of food. Therefore, it is necessary to remove the wax inside by winterization dewaxing. During the winterization dewaxing, the temperature is lowered little by little to make the wax inside crystallize. The filter machine filters out the wax, and finally obtains the crystal clear finished tea seed oil.

The traditional camellia seed oil production method is divided into physical pressing oil production method and leaching oil production method, and physical pressing is divided into cold pressing oil production method and hot pressing oil production method. Regardless of whether it is cold pressing or hot pressing, physical pressing or leaching to make oil, the tea seed oil produced is called crude oil, and it must be refined in refining equipment before it can enter the market.
