Abstracts

According to our (Global Info Research) latest study, the global Camera for EUV market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The advent of fast, affordable, high-power lasers has driven advances in areas such as soft X-ray and EUV imaging, plyometrics, spectroscopy, and tomography. Coupled with increasing investments in industrial EUV lithography and semiconductor metrology processes, the need for fast, high-resolution, and sensitive detectors in the 20 eV to 10 keV range continues to increase. CCDs have long been the technology of choice for direct EUV and X-ray imaging, as well as some scattering applications. sCMOS technology has finally been introduced to enable faster, lower-noise solutions to meet market demands for global semiconductor manufacturing, brighter, faster laser sources, and next-generation synchrotron upgrades. Scientific cameras based on CCDs, or sCMOS, are sensitive to wavelengths from EUV to soft X-rays. It is a direct detector, meaning that soft X-ray and EUV imaging applications can benefit from improved quantum efficiency (QE) when photons are converted directly to charge in the detector silicon layer; as opposed to approaches that use scintillators and indirect detection.
