Abstracts

According to our (Global Info Research) latest study, the global Camera Image Sensor market size was valued at USD 25720 million in 2022 and is forecast to a readjusted size of USD 42310 million by 2029 with a CAGR of 7.4% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The image sensor of the camera is responsible for converting the light and color spectrum into electrical signals for the camera to convert into zeroes and ones. All commercially available digital cameras (still, movie, or security) use one of two possible technologies for the camera's image sensor: CCD or CMOS. The solid-state image sensor chip contains pixels which are made up of light sensitive elements, micro lenses, and micro electrical components. The chips are manufactured by semiconductor companies and cut from wafers. The wire bonds transfer the signal from the die to the contact pads at the back of the sensor. The packaging protects the sensor chip and wire bonds from physical and environmental harm, provides thermal dissipation, and includes interconnecting electronics for signal transfer. A transparent window in the front of the packaging called a cover glass protects the sensor chip and wires while allowing light to reach the light sensitive area.
