DIC camera, or Digital Image Correlation, is a device that uses digital image correlation technology to measure the shape, displacement, and deformation of an object. This technology calculates the displacement vector and strain distribution on the surface of the object by comparing digital images of the same object in different states. DIC cameras are widely used in fields such as materials science, mechanical engineering, and biomechanics, and are particularly suitable for studying the behavior of materials under stress. It can provide full-field non-contact and precise measurement and is a very effective experimental mechanics analysis tool.
