Abstracts

The global CAN FD IC market size is expected to reach \$ 3436 million by 2032, rising at a market growth of 10.5% CAGR during the forecast period (2026-2032).

A CAN FD IC is an integrated circuit that implements the CAN FD (Flexible Data-rate) protocol, enabling high-speed and reliable communication in automotive and industrial networks. It allows data transmission with higher bandwidth than classic CAN by supporting faster data rates during the data phase, while maintaining compatibility with traditional CAN systems. In 2025, global CAN FD IC production reached approximately 892.23 M units, with an average global market price of around US\$ 1.85 per unit. Annual production capacity is 1033 M Units. Gross Profit Margin?62%. The CAN FD IC industry chain is highly concentrated and technology-driven. Upstream consists of semiconductor material suppliers, wafer fabrication foundries, and analog/mixed-signal IP providers. Midstream is dominated by a small number of global IC designers such as NXP, Infineon, Texas Instruments, and Renesas, which integrate CAN FD controllers and transceivers into automotive-grade chips. Downstream applications are mainly automotive OEMs, Tier-1 suppliers, and industrial automation companies, where CAN FD ICs are embedded in ECUs, domain controllers, and sensor networks to enable reliable in-vehicle communication. CAN FD IC is a mature but steadily evolving segment driven by automotive electrification and architecture upgrades. While unit prices are relatively low, the product is strategically critical because it directly determines communication reliability inside vehicles. The long-term opportunity is not in price expansion but in volume growth and integration into more complex domain-based and zonal architectures, where demand per vehicle continues to increase.
