According to our (Global Info Research) latest study, the global CAN Protocol Converter market size was valued at US\$ 1869 million in 2025 and is forecast to a readjusted size of US\$ 3106 million by 2032 with a CAGR of 7.6% during review period.

CAN protocol converter is a communication interface device used to realize data conversion between CAN bus and other communication protocols. CAN is a high-reliability and high-real-time serial communication protocol, which is often used for data exchange between multi-node devices. In actual applications, CAN devices often need to interact with other types of control systems or host computers, such as devices using RS232, RS485, Modbus, Ethernet, USB, Profinet and other protocols. The role of CAN protocol converter is to perform real-time bidirectional conversion of data between different protocols so that devices using different communication standards can work together smoothly. It usually has the characteristics of high speed, anti-interference, isolation protection, etc., supports multiple baud rates and protocol type conversions, and some models also integrate advanced functions such as filtering, ID mapping, data buffering, and diagnosis. By deploying CAN protocol converter, system compatibility can be expanded and communication efficiency can be improved without changing the original equipment. It is one of the key components for building a multi-protocol integrated system.
