Abstracts

The global Capacitive Point Level Sensors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Capacitance type level switch is based on RF capacitance principle. Capacitance is formed between the level sensing probe and metallic wall of the vessel which act as two electrodes, and the application media acts as a dielectric medium when the sensor is introduced into the vessel. These electrodes are separated by an insulator by suitable media known as a dielectric medium. When the level of process material rises, the value of dielectric changes which results in change in the value of capacitance between the level sensing probe and the vessel wall. This change can be detected and measured by the Radio Frequency technique.

capacitive point level sensors are universally applicable in bulk solids, granulates, powders, liquids, highly viscous oils, slurries and pastes.

This report studies the global Capacitive Point Level Sensors production, demand, key manufacturers, and key regions.
