Abstracts

Capacitive torque sensor is a sensor that measures torque by measuring the effect of torque on the sensor's internal structure, such as an elastically deformed spring or elastomer. When torque acts on the sensor, the structure inside the sensor will undergo slight deformation, causing the capacitance inside the sensor to change. This change can be converted into an electrical signal and processed and measured through the corresponding circuit to obtain the torque value.

According to our (Global Info Research) latest study, the global Capacitive Torque Sensor market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
