According to our (Global Info Research) latest study, the global Capillary Electrophoresis market size was valued at USD 334.8 million in 2023 and is forecast to a readjusted size of USD 443.7 million by 2030 with a CAGR of 4.1% during review period.

Capillary electrophoresis system is an instrument used in separation of nucleic acids and proteins with high accuracy and within short span of time. Capillary electrophoresis is based on the principle of separation of molecules according to charge and size. The basic difference between capillary electrophoresis and gel electrophoresis is that the molecules are separated inside the small capillary tube which is filled with conductive buffer rather than gel. Separation of molecules using capillary electrophoresis is faster and gives higher resolution as the thin tubes have a higher surface-to-volume ratio, which enables to dissipate heat faster, and thus run at high voltages without overheating. Capillary electrophoresis requires small amount of sample which is advantageous in the analysis of rare and expensive sample.

One trend in market is rise of hyphenated technology. Hyphenation is the combination of one or more functions into a single product. It often requires two individual instruments to be built under a single casing, which can work in tandem with each other. This has resulted in an increased adoption of CE-MS, the combination of the liquid separation process of capillary electrophoresis with mass spectrometry. This combines the advantages to provide high separation efficiency and molecular mass information in a single analysis. It requires a minimal volume, has high resolving power and sensitivity, and can analyze at high speed. It has applications in basic research in proteomics and quantitative analysis of biomolecules, as well as in clinical medicine.
