Abstracts

The global Caprolactone Acrylate (CA) market size is expected to reach \$ 48.15 million by 2032, rising at a market growth of 4.8% CAGR during the forecast period (2026-2032).

Caprolactone Acrylate (CA) is a functional acrylic monomer with hydroxyl functional groups, synthesized by reacting caprolactone with acrylic acid. Its CAS number is 110489-05-9. Its molecular structure possesses both acrylic ester double bonds that can participate in polymerization reactions and primary hydroxyl groups that can undergo crosslinking reactions, making it a key reactive diluent in UV curing systems. The core feature of this monomer is that the polycaprolactone segment in the molecular chain endows the material with high flexibility, low shrinkage, low odor, excellent hydrolysis resistance, and impact toughness, which can effectively improve the adhesion and elasticity of the coating. At the application level, CA is widely used in radiation cured coatings, inks, adhesives, and 3D printing materials, particularly suitable for plastic coatings, metallic paints, and adhesive systems. In 2025, global Caprolactone Acrylate (CA) production reached approximately 12,753 MT, with an average global market price of around US\$ 2,637 per MT.

Caprolactone acrylate is a high-performance specialty monomer in the UV/EB curing industry chain, with a continuously growing market size but relatively limited absolute value. From the perspective of product types, the market is divided into two levels based on purity: ≥ 98% and ≥ 99%, in order to meet the technical requirements of different downstream applications. From the perspective of development trends, the market driving force of CA mainly comes from the 'oil to powder' conversion and energy curing substitution process driven by stricter environmental regulations, as well as the expansion of emerging application scenarios such as 3D printing and high-end

functional coatings. Looking ahead, as the penetration rate of UV curing technology in downstream industrial manufacturing continues to increase, CA monomers with unique flexible modification functions are expected to maintain a steady growth trend.
