The global Caps Transfer Buffers market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Caps Transfer Buffer is a solution used in the process of Western blotting, a widely used technique in molecular biology for detecting specific proteins in a sample. This buffer is crucial for transferring proteins from a polyacrylamide gel to a membrane, typically made of nitrocellulose or PVDF (polyvinylidene difluoride). The Caps Transfer Buffer facilitates the migration of proteins out of the gel and onto the membrane during the transfer step of the Western blotting procedure. It contains specific salts and detergents that help maintain the stability of proteins and promote efficient transfer while minimizing protein aggregation or degradation. Caps Transfer Buffer is essential for obtaining reliable and reproducible results in Western blot experiments, enabling the detection and analysis of proteins of interest.

This report studies the global Caps Transfer Buffers production, demand, key manufacturers, and key regions.
