## Abstracts

According to our (Global Info Research) latest study, the global Car Active Noise Cancellation Algorithm market size was valued at US\$ 28.40 million in 2025 and is forecast to a readjusted size of US\$ 73.36 million by 2032 with a CAGR of 12.0% during review period.

Active noise cancellation algorithms for automobiles are essentially an adaptive signal processing and control algorithm: They collect noise 'reference/error signals' through in-vehicle/body sensors (commonly microphones, accelerometers, etc.), calculate 'anti-noise' with equal amplitude but opposite phase to the noise in real time in the DSP/vehicle domain controller, and then use the vehicle's speakers to cancel out noise in the target frequency band (especially low-frequency road noise, tire noise, and some engine order noise). In engineering implementation, a feedforward/feedback/hybrid architecture is typically used, along with adaptive filtering (such as Filtered-x LMS) to track changes in vehicle speed, road surface, and vehicle structure transfer functions, thus balancing 'comfort improvement' with 'system stability/computing cost.' The global market size is estimated at around \$30 million by 2025.
