According to our (Global Info Research) latest study, the global Carbon Filtration Systems market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Carbon Filtration System is a equipment which use activated carbon to remove contaminants and impurities, utilizing chemical adsorption. Each piece of carbon is designed to provide a large section of surface area, in order to allow contaminants the most possible exposure to the filter media. One pound (450 g) of activated carbon contains a surface area of approximately 100 acres (40 Hectares).

This carbon is generally activated with a positive charge and is designed to attract negatively charged water contaminants. Carbon Filtration can be employed in several different applications such as removing foul taste, odor, and hazardous chemicals.
