Abstracts

The global Car Intake and Exhaust System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

After fresh air and gasoline are mixed into the engine for combustion, high-temperature and high-pressure gas is generated to push the piston. When the gas energy is released, it is no longer valuable to the engine, and these gases become exhaust gas and are discharged out of the engine. After the exhaust gas is discharged from the cylinder, it immediately enters the exhaust manifold. After the exhaust manifolds of each cylinder are collected, the exhaust gas is discharged through the exhaust pipe. Just like the intake manifold, the gas leaves the engine in the form of pulses in the exhaust manifold, so the length and curvature of the exhaust manifold of each cylinder should be designed to be as consistent as possible so that the exhaust of each cylinder can be the same. of smoothness. After being discarded from the exhaust manifold, a catalytic converter is connected to convert incompletely burned pollutants into harmless substances to protect the environment. It is connected to the muffler after it comes out of the catalytic converter. The cross-section of the muffler is a round or oval object, which is mostly welded with thin steel plates. It is installed in the middle or rear position of the exhaust system. It has a series of partitions inside. The chamber, orifice and pipe use the phenomenon of sound wave reflection to interfere with each other and cancel each other out, so that the sound energy gradually weakens to isolate and attenuate the pulsating pressure generated every time the exhaust valve is opened.

The automobile exhaust system refers to the system that collects and emits exhaust gases, including exhaust manifolds, exhaust pipes, mufflers, tailpipes and resonators.
