Abstracts

According to our (Global Info Research) latest study, the global CAR-NK Cell Therapy market size was valued at US\$ 2438 million in 2025 and is forecast to a readjusted size of US\$ 3547 million by 2032 with a CAGR of 5.6% during review period.

CAR-NK cell therapy is an advanced cellular therapy technique that combines the natural anticancer ability of natural killer (NK) cells with the specific targeting function of chimeric antigen receptors (CARs). Through genetic engineering, CAR structures capable of recognizing specific tumor antigens are introduced into NK cells, thereby enhancing their targeting ability and killing power. This therapy has shown great potential in treating various types of cancers, including hematological tumors and solid tumors. CAR-NK cell therapy has lower toxic and side effects and better safety, making it a promising supplement or alternative to CAR-T cell therapy.

Market Drivers

Superior Safety and 'Off-the-Shelf' Potential over CAR-T therapies is a critical driver. CAR-NK cells carry a significantly lower risk of cytokine release syndrome (CRS), neurotoxicity, and graft-versus-host disease (GvHD). Furthermore, they can be developed as allogeneic, 'off-the-shelf' products from healthy donors, unlike patient-specific CAR-T cells. This enables faster, more scalable, and cost-effective production.

Technological Advancements and Clinical Progress are accelerating market growth. These include the development of genetically engineered CAR-NK cells, integration of induced pluripotent stem cell (iPSC)-derived NK cells for mass production, and improved cryopreservation techniques. The pipeline is robust, with numerous

companies advancing therapies into late-stage clinical trials.
