Abstracts

The global Car Oxygen Concentrator market size is expected to reach \$ 4805 million by 2032, rising at a market growth of 6.4% CAGR during the forecast period (2026-2032).

Car Oxygen Concentrator is a compact oxygen supply system specifically designed for in-vehicle applications, utilizing pressure swing adsorption technology to extract oxygen from ambient air and deliver a stable and continuous oxygen flow during driving scenarios. It is optimized for integration with vehicle environments, featuring stable oxygen concentration, compact form factor, and compatibility with onboard power systems, making it suitable for long-distance travel, high-altitude driving, and in-car respiratory support. Its advantages include real-time oxygen generation without storage, high portability, low operating noise, and enhanced operational safety. In 2025, the industry's capacity utilization rate was about 77%, while the average gross margin reached approximately 40%. Production in 2025 totaled 8.57 million units with an average price of 350 USD/unit. The upstream of Car Oxygen Concentrator primarily consists of zeolite molecular sieves and miniature oil-free air compressors, with representative suppliers such as Arkema, Honeywell, BASF, BOE Technology, Hanbell Precise Machinery, and Kaishan Group providing stable material performance and core component reliability. The midstream focuses on system integration, oxygen generation module design, power management, noise reduction, and product reliability testing to ensure stable oxygen output and vehicle adaptability. The downstream is mainly driven by online and offline sales channels.

Car Oxygen Concentrator is a vehicle-mounted oxygen supply device designed to provide continuous oxygen output in mobile environments through pressure swing adsorption technology, supporting scenarios such as long-distance travel and high-altitude driving. Its practical value is increasingly evident under the influence of aging

demographics, where demand for convenient and reliable oxygen support during mobility continues to rise. In current applications, product competitiveness is mainly reflected in oxygen concentration stability, noise control, system durability, and compatibility with vehicle power systems. At the same time, ongoing advancements in molecular sieve performance, compressor efficiency, and structural miniaturization are gradually improving product consistency and user experience. From an industry perspective, relatively high gross margins are supported by technical barriers in core components and system integration, while the current capacity utilization level indicates that supply-side optimization is still underway. As manufacturers continue to refine cost structures and enhance product reliability, the industry is moving toward more standardized production and stable profitability driven by demographic trends and technology upgrades.
