According to our (Global Info Research) latest study, the global Carbide Fillers market size was valued at US\$ 1560 million in 2024 and is forecast to a readjusted size of USD 1956 million by 2031 with a CAGR of 3.3% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Carbide fillers mainly include silicon carbide and boron carbide fillers. Carbide fillers are widely used in many fields. Silicon carbide (SiC) is a compound with strong covalent bonds. Common ones are hexagonal β -SiC and cubic β -SiC, which are similar to diamond structures. Silicon carbide has the characteristics of corrosion resistance, high temperature resistance, high strength, good thermal conductivity, and impact resistance. It also has the advantages of high thermal conductivity, oxidation resistance, and good thermal stability. It is often used as a packaging material in the microelectronics industry. However, the carbon and graphite produced during the synthesis of silicon carbide are difficult to remove, resulting in low product purity and high electrical conductivity, which limits its application in materials with high insulation performance requirements; and its density is high, and it is easy to precipitate and delaminate in silica gel. Boron carbide (B₄C) is a refractory superhard material with high thermal conductivity, but it is expensive and is not widely used in insulating polymer materials.
