Abstracts

According to our latest research, the global Carbide Hole Making Tool market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Hole making tools consist of a wide range of tooling specifically designed and manufactured to create holes into a workpiece, part or component. Hole making processes like drilling and reaming can be performed on a variety of machines, including both milling machines and machining centres (lathes). The process of hole making involves cutting away unwanted material by piercing the surface of the workpiece at a given diameter. Carbide drills are extremely hard, giving carbide tooling increased wear resistance and tool life over HSS and Powder Metal tools. Carbide drills are usually more expensive than HSS drills, but the difference in performance (productivity) and tool life means that, in the long run with the right machining conditions, carbide can offer higher cost efficiency.
