The global Carbon Black Powder market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Carbon black is a fine powder produced by incomplete combustion of carbon-containing raw materials (petroleum or coal tar). Its composition is mainly carbon and contains a small amount of oxygen, hydrogen and sulfur. The appearance is pure black fine particles or powder, approximately spherical, insoluble in water, acid and alkali, and can be burned into carbon dioxide in the air. Carbon black is an important reinforcing raw material in the rubber industry. It can not only improve the strength of rubber products, but also improve the process performance of rubber materials, endow products with various properties such as wear resistance, tear resistance, and heat resistance, and prolong the service life of products; at the same time It is also an excellent coloring or toner, widely used in rubber and plastic processing, ink, paint, chemical fiber, leather, electronics, metallurgy and other industries.
