Abstracts

The global Carbon Capture Utilization and Sstorage (CCUS) market size is expected to reach \$ 8210 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

Carbon Capture, Utilization and Storage (CCUS) refers to a set of technologies that capture carbon dioxide (CO₂) from large point sources such as power plants and industrial facilities, and then either utilize the captured CO₂ as a feedstock for products (e.g., chemicals, synthetic fuels, enhanced oil recovery) or permanently store it in geological formations such as depleted oil and gas reservoirs or deep saline aquifers. CCUS is widely regarded as a critical decarbonization solution for hard-to-abate sectors and a key enabler for achieving long-term net-zero emission targets.

The global CCUS market is transitioning from pilot and demonstration projects toward large-scale commercial deployment, driven by net-zero commitments, carbon pricing mechanisms, industrial decarbonization pressure, and energy-sector transition needs. Currently, carbon capture and storage (CCS) dominates deployment, while carbon utilization (CCU) remains relatively limited and concentrated in chemicals and synthetic fuels. North America and Europe lead in project development and policy support, while China and the Middle East are rapidly expanding large industrial CCUS projects. In the long term, declining capture costs, improved CO₂ transport and storage infrastructure, and mature carbon markets are expected to accelerate CCUS adoption.

This report studies the global Carbon Capture Utilization and Sstorage (CCUS) demand, key companies, and key regions.
