Abstracts

According to our (Global Info Research) latest study, the global Carbon-coated Foils market size was valued at US\$ 1349 million in 2025 and is forecast to a readjusted size of US\$ 2235 million by 2032 with a CAGR of 7.9% during review period.

The typical gross profit margin for Carbon-coated Foils is between 20% and 40%. Carbon-coated foils are functional current collector materials in which a thin conductive carbon layer is coated onto the surface of metal foils, typically aluminum foil for cathodes and copper foil for anodes in rechargeable batteries. The carbon coating improves interfacial conductivity between the metal collector and active materials, enhances adhesion, reduces contact resistance, and suppresses corrosion or side reactions. As a result, carbon-coated foils significantly improve rate capability, cycling stability, and high-temperature reliability of batteries, and are widely used in lithium-ion, sodium-ion, and next-generation solid-state battery systems. In 2025, global Carbon-coated Foils production reached approximately 122 k tons, with an average global market price of around US\$11267 per ton. The production capacity for Carbon-coated Foils in 2025 was approximately 140 k tons.
