Abstracts

The global Carbon Dioxide Pipelines market size is expected to reach \$ 1575 million by 2032, rising at a market growth of 6.8% CAGR during the forecast period (2026-2032).

In 2025, global Carbon Dioxide Pipelines approximately 15,953 km, with an average global market price of around US\$ 62 per m. Gross margin is about 49%. The cost is 32 usd. The Production is about 18,000 km. Carbon Dioxide Pipelines are specialized pipelines designed to transport carbon dioxide (CO₂) over long distances, typically from industrial sources (such as power plants, refineries, or chemical factories) to storage sites or utilization locations. These pipelines are a key component of carbon capture, utilization, and storage (CCUS) systems, which aim to reduce CO₂ emissions by capturing and transporting CO₂ for either permanent storage (usually in geological formations) or for use in enhanced oil recovery (EOR) or other industrial processes.

1. Classification by CO₂ phase

CO₂ pipelines can be classified into gaseous CO₂ pipelines, liquid CO₂ pipelines, and supercritical CO₂ pipelines. Gaseous pipelines are mainly used for short-distance and low-pressure transport, while liquid pipelines serve medium-distance applications. Supercritical CO₂ pipelines dominate CCS projects due to high density, low volumetric flow rate, and superior transport efficiency.

2. Classification by application scenario

CO₂ pipelines can be categorised into industrial CO₂ pipelines, enhanced oil recovery (EOR) pipelines, and CCS/CCUS pipelines. Industrial pipelines supply CO₂ for chemical and food industries, EOR pipelines inject CO₂ into oil fields to enhance production, and CCS/CCUS pipelines transport captured CO₂ to storage or utilisation sites, forming the backbone of carbon reduction infrastructure.

3. Classification by transport distance

From an engineering perspective, CO₂ pipelines can be divided into short-distance pipelines, medium-distance regional pipelines, and long-distance trunk pipelines. Short-distance systems often use gaseous or liquid CO₂, while medium and long-distance pipelines predominantly adopt supercritical CO₂ for economic efficiency.

4. Classification by operating pressure

CO₂ pipelines can be grouped into low-pressure, medium-pressure and high-pressure systems. High-pressure pipelines are required for liquid and supercritical CO₂ transport, typically operating at 8–20 MPa in large-scale CCS projects.

5. Classification by network configuration

Structurally, CO₂ pipelines include point-to-point pipelines, gathering networks, and trunk pipeline systems. Point-to-point pipelines directly connect emission sources to storage sites, while trunk networks integrate multiple sources and destinations, resembling future regional carbon transport grids.
