A carbon accounting system is a software system used to track, record, and report carbon emission data of an organization or enterprise. These systems can help companies assess their carbon footprint and develop emission reduction plans to meet their carbon reduction goals. It typically includes features in the following areas:

Data collection: The system can automatically or manually collect relevant data, such as enterprise electricity consumption, vehicle fuel consumption, exhaust emissions generated during the production process, etc.

Data calculation: The system can use various calculation methods, such as international standards, regional standards, etc., to calculate the carbon emissions of enterprises.

Data visualization: The system can present data in the form of charts, reports, etc., so that enterprises can better understand their carbon emissions.

Risk assessment: The system can assess the impact of a company's carbon emissions on climate change and provide recommendations and guidance to reduce the company's environmental risks.
