The global Carbon Emission Continuous Monitoring System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Global climate warming is the most significant environmental problem currently facing mankind and one of the most complex challenges facing mankind in the 21st century. It is also the key to the world's energy prospects and has become an important factor affecting the world's economy and politics. The emission of greenhouse gases, mainly carbon, caused by human activities is the main cause of global warming. Generally, continuous emission systems (CEMS) can be used to monitor carbon emissions. The European Commission launched the EU carbon emissions trading system in 2005 to officially carry out CO₂ emission monitoring.

Carbon Emission Continuous Monitoring System is a fixed or regional emission source monitoring system developed based on the current situation of carbon emission monitoring. It can continuously monitor the concentration and total emission of gaseous pollutants or particulate matter emitted by air pollution sources online, and monitor the front-end monitoring sites. The data is statistically analyzed to complete carbon emission monitoring, verification and early warning, to achieve accurate monitoring of carbon emissions from key pollutant-emitting enterprises and key pollution sources, and to provide strong technical support for digital, intelligent, and online monitoring of carbon emissions. Compared with the carbon emission data of material accounting, the system uses real-time monitoring data to establish a carbon emission accounting method system based on monitoring data, which can further improve the accuracy and real-time nature of carbon emission accounting data.

This report studies the global Carbon Emission Continuous Monitoring System demand, key companies, and key regions.
